Recombinant bFGF is used to promote healing of wounds, bone fractures, damaged myocardial tissue etc. and, since it increases neuronal survival and promotes neurite outgrowth, may also be used in treatment of neurological disorders such as Alzheimer's and Parkinson's diseases. bFGF may also be used for detection of specific inhibitors; for treatment of cell cultures in vitro before transplant and for inducing release of tissue plasminogen activator or collagenase, e.g. for treatment of a chronic tendency to form embolism. Recombinant bFGF can be produced on a large cell.
Human basic fibroblast growth factor - produced by recombinant DNA techniques, useful for healing wounds, prophylaxis, thrombosis and arteriosclerosis treatment, etc.
                                                                                                                               Kurokawa

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DNA encoding the sequence may be mutated to encode an analogue, of human basic fibroblast growth factor (bFGF) bFGF-C78/965, which has reduced affinity for heparin. One or more positively-charged AAs in the heparin-binding domain (AAs 128-138) are replaced by neutral or negatively-charged residues as indicated in the feature table. A recombinant vector (pUC9-TSF11 or pUC9delH3-pTSF-3) contg. the mutated DNA can be used to transform bacterial or mammalian host cells for prodn. of the analogue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Recombinant DNA encoding new fibroblast growth factor analogues - useful eg for accelerating wound healing to control neovascularisation.

They may also have tuses in the CNS and PNS in treatment of cell death and ne
The peptide sequence was deduced from the synthetic DNA sequence prepd. as described in EP-363875. E. coll cells transformed with t synthetic DNA were lysed and the supernatent purified, giving a 50:50 mixture of a 154 residue bFGF (2-155) having the amino acid sequence of the 155 residue form (Abraham et al., Science, 23, 545, 1986) shown here but without the N-terminal Met; and a 153 residue bFGF (3-155). An adduct of bFGF formed with heparin or heperan sulphate contg. the bFGF 9-10 Leu-Pro bond can be cleaved with pepsin A or cathepsin D to cleave this bond and release a peptide with the N-terminus be deleted up to and including residue 9, sequentially. This cleavage method can be used to obtain a pure form of the 146 amino acid bFGF (10-155) bFGF. The prod. can be us

These fusion peptides may be used for anti-aging cosmetics and in wound healing after surgery.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; fibronectin; FN; fibroblast cell growth factor; FGF; fusion; cell adhesion; cell growth; anti-aging; cosmetics;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Вþ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      В
                           availability of the TA. The conjugates of the invention are used to inhibit cell proliferation in cells carrying the particular growth factor receptor; also when TA is DNA it can be used to deliver this to cells (for gene therapy). A specific application is to prevent excessive proliferation of epithelial cells, fibroblasts and keratinocytes in the anterior eye after surgery, partic to prevent recurrence of pterygii after surgical removal, closure of trabeculectomy after glaucoma surgery and corneal clouding after excimer laser treatment. Other conditions which may be treated inclu tumours, restenosis, psoriasis, Dupuytren's contracture, diabetic complications, Kaposi's sarcoma and rheumatoid arthritis.
                                                                                                                                                                                                           AAR80776-84 are fibroblast growth factors (FGF) FGF-1 to FGF-9 respectively. DNA encoding these fibroblast growth factors can be used to create an FGF/saporin fusion protein. DNA encoding such fusi proteins are useful for targetting saporin (a cytotoxin) to a cell carrying the FGF receptor. Targetted agents (TA) other than saporin which may be used include in partic. DNA encoding a therapeutic protantisense DNA or other cytotoxic agent. The linker sequence within t fusion protein may increases serum stability or intracellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Conjugate; fibroblast growth factor; FGF; cytotoxin; saporin; eye; cell proliferation; regulation; pterygia; corneal clouding; cancer; psoriasis; rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                              New conjugates of growth factor receptor ligand and targetted agent - partic. DNA or cytotoxin, used to control cell proliferation in the eye, e.g. to prevent growth of pterygii and corneal clouding

                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is a human fibronectin amino-terminal oligopeptide, which was used in the development of a novel method for increasing the efficiency of gene introduction into a target cell using a retroviral vector. The method comprises carrying out viral infection of the target cell in the presence of a retrovirus and target cell binding substance or substances. The method can be used to effectively introduce genes into target cells for the gene therapy of cancer and viral diseases, e.g. AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              substance which

The method is for the control of human immunodeficiency virus (HIV) infection using a composition which comprises a functional substance which participates in the infection HIV. The method is used to control HIV-infection.

Claimed DNA molecules of the invention encode FGF mutein polypeptides (see AAW75711-20) that show reduced FGF receptor binding activity but which retain the ability to bind heparin. For FGF-2, amino acid residues 95, 101 or 104 are preferably replaced by other amino acid residues, with an optional further replacement of the Glu-96 residue. The mutein may be further modified by replacement of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Fibroblast growth factor mutein and DNA - having reduced receptor binding and able to bind heparin, useful for treating and regulating heparin-related disorders e.g. thrombosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Misc-difference

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
